THE IDEAS DJ

A field guide to mixing ideas.

Eight disciplines. A method for discovering useful connections. And a reminder that analogy is an invitation to investigate, not a scientific conclusion.

THE SHORT VERSION

The best remix finds a productive question between two disciplines. It neither discards their differences nor pretends that a beautiful metaphor proves anything. Start with a genuine problem, study each field on its own terms, map a precise connection, and make something testable.

Inside: the mixing protocol; eight starting decks; six example remixes; an original idea worksheet; selected Sahilverse routes; and a final calibration checklist.

Explore the live mixer at dj.sahilverse.online. No account, payment or tracking is required.

01 / THE FOUR-MOVE MIX

A method, not a metaphor alone.

1. Listen separately

Understand what each field actually studies, what evidence it uses and what its boundaries are.

2. Find the shared question

Look for a mechanism, constraint, structure or tension. “Both are interesting” is not a useful intersection.

3. Make a provisional remix

Write one insight and one alternative explanation. Label analogy, hypothesis and established observation differently.

4. Test something small

Create a reversible experiment, an editorial comparison, a prototype or a sensory observation. Record what changed your mind.

THE ANTI-OVERCLAIM RULE

When your analogy sounds irresistible, write what would make it wrong. An intellectually honest remix tells the reader where the beat ends.

02 / THE EIGHT DECKS

Choose your source material.

Psychology & behaviour

Behaviour is rarely a simple contest between willpower and laziness. Context, social meaning, identity, emotion and friction all have something to say.

Perfumery & scent

Perfume sits at the meeting point of chemistry, memory, craft, identity and cultural storytelling. An unusually rich place to practice interdisciplinary thinking.

Hip-hop & music

Hip-hop is a creative language: sampling, repetition, revision, storytelling and making a meaningful whole from materials already in circulation.

AI & creative technology

Creative coding, AI and the web are mediums for turning abstract questions into interactive experiences, provided the interaction teaches or reveals something real.

Human capital & work

The work question is bigger than productivity. It concerns learning, skill, dignity, invisible labour and the conditions in which people can contribute without being depleted.

Philosophy & meaning

Philosophy is less about acquiring a prestigious set of answers and more about learning which questions change how we live: agency, identity, reciprocity, consciousness and enough.

Entrepreneurship & kirana

Small business is a living classroom for economics, customer trust, pricing, improvisation, service work and the limits of tidy management frameworks.

Writing, learning & culture

Writing is how fuzzy experiences become shareable. Learning is how ideas become more reliable. Both benefit from curiosity, revision and the courage not to turn everything into a grade.

03 / SIX READY-TO-TRY REMIXES

Unexpected does not mean ungrounded.

The smell of a question

Olfaction makes a useful reminder that feeling is situated: association, attention and setting matter. Compose a sensory prompt that invites reflection, then ask what is personal rather than universal.

Try asking: How might we design an experience that invites memory without pretending to control it?

Hooks, habits and identity

A repeated hook can make a sentence memorable, just as repeated cues can shape attention. But a catchy line is not a behavioural intervention by itself. Explore the tension between the stories people tell and the actions environments make easy.

Try asking: Could a memorable lyric expose a friction point rather than hide it?

The invisible ledger

The shop has two books: transactions you can count and relationships that keep the place viable. Explore where skill, care and unseen effort appear—and disappear—in business measures.

Try asking: What creates value here that never appears in the daily sales total?

A machine for better questions

An interactive model is philosophy with knobs. It lets a visitor try assumptions, observe a consequence and argue with the result. Its job is not to pretend that a generated output is truth.

Try asking: Which assumption would you make visible on the interface?

Top notes and opening bars

A scent and a verse both unfold over time: first impression, development, aftertaste. The analogy is useful for pacing creative work; it does not make aroma and sound equivalent experiences.

Try asking: Where does your piece need a pause rather than another note?

The essay you can touch

A persuasive text asks the reader to imagine alternatives; an interactive essay lets them try them. Offer clear choices, meaningful consequences and an honest account of what the model leaves out.

Try asking: What should the visitor learn by changing one variable?

04 / FIELD PRACTICE

Take a blank record.

Pick two areas of interest. Use this worksheet to avoid jumping straight to the satisfying conclusion.

DECK A / WHAT DO I KNOW?

Describe the first field in observable language. Which claims are well supported?

DECK B / WHAT DO I KNOW?

Describe the second field without using the first field’s vocabulary.

THE CROSSOVER

Write one genuine shared question, not a slogan.

THE REVERSE PLAY

How could this analogy mislead someone? What differs between the fields?

THE SMALL EXPERIMENT

What could I observe, compare, write, make or prototype in 30 minutes?

THE UPDATE

What evidence would make me revise or abandon this idea?

05 / FOLLOW THE SAMPLE TRAIL

Start with existing work.

These routes come from Sahilverse’s public project atlas. Their inclusion reflects thematic relevance; a third-party or independently hosted URL can change later.

06 / FINAL CHECK

Before you release the mix.

☐ Can someone understand both fields without agreeing with me?

☐ Is the shared question specific enough to investigate?

☐ Did I credit ideas or communities I borrowed from?

☐ Have I marked metaphor, inference and evidence separately?

☐ Does my prototype genuinely help somebody think or act?

☐ What have I left uncertain?

☐ Can someone challenge the mix without being dismissed?

A NOTE FROM THE DJ

The point is not to look interdisciplinary. The point is to notice what one field cannot explain alone, and bring the second field in with care.
